GUIDE TO
FILM-FORMING
HUMECTANTS
for Frizz

What are humectants and how are film-forming humectants different?

Simple humectants, such as glycerin, propylene glycol, and sorbitol, attract and bind water vapor from the surrounding air when it is abundant. This helps your hair to remain hydrated. Moisturized and hydrated hair has good elasticity, bounce, and definition. Simple humectants also prevent a hard hold gel from turning the hair dry and crusty. By taking water vapor from the air, simple humectants keep the gel in your hair hydrated and flexible.

Simple humectants work well when the humidity is just right. But beware. Under low humidity or low dew point conditions, these humectants can pull moisture from the hair. This is one reason why humectants such as glycerin and sorbitol can release water fairly readily and make the hair feel very dry in winter or dry climates. Conversely, in hot and high humidity climates, simple humectants

can draw moisture into the hair, raising the cuticle layer, and causing frizz. This is the main reason why many curlies living in hot and humid places (such as Florida) avoid glycerin and sorbitol in their styling products.

In contrast, film-forming humectants are large, complex molecules that form a film over the hair keeping moisture in to prevent the hair from dehydrating, or from pulling water vapor into the hair. What's amazing is that they work well in any weather! When a film-forming humectant forms a clear flexible film-seal over the hair, water inside the hair is blocked and has to pass through the film. This results in less water loss from the hair to the surrounding air, and conversely, prevents frizz-causing moisture from entering the hair.

What are film-forming humectants derived from?

Many film-forming humectants are derived from plant tissues. They are typically slippery, like a gel, clear, and dry smooth. **Common film-forming humectants include:**

- Flax Seed Gel (Linseed)
- Okra Gel (Made From Okra Seed Pods)
- Aloe Vera
- Hydroxyethylcellulose
- Pectin
- Xanthan Gum
- Guar Gum
- Marshmallow Root
- Slippery Elm
- Carrageenan (Also known as Irish Moss Or Seaweed Extract, Sea Emollient, Sea Algae, Sea Vegetable)
- Nettle Leaf Tea Or Nettle Extract
- Hydroxypropyltrimonium Honey
- Panthenol

To keep hair hydrated for several days after wash day, it is wise to use a good styling product (gel, cream and/or leave-in) with a film-forming humectant. Film-forming humectants need to stay in the hair to work and can be rinsed out of the hair, which is why these are best in your styling products at the end of your wash day.

Tip

Look for film forming humectants in stylers such as leave-ins, creams and gels

Protein humectants

Other humectants include proteins from plant and animal sources, which help slow water loss from the hair. Hydrolyzed proteins and amino acids can get inside the hair shaft to moisturize from the inside whereas non-hydrolyzed proteins form clear films on top of the hair. Hydrolyzed proteins typically stay in the hair even when the hair is rinsed and thus can also be used in conditioners and deep conditioners.

Tip

Look for hydrolyzed proteins in conditioners and deep conditioners

Examples of smaller proteins include:

- Anything that says hydrolyzed [source]
- Peptides
- Amino acids (they have names such as arginine, threonine, proline, etc.)

Examples of larger proteins include:

- Keratin
- Collagen
- Silk protein

GELS WITH FILM-FORMING INGREDIENTS

The complete ingredient list is shown for each product with **FILM-FORMING INGREDIENTS** in **BLUE** and **PROTEINS** in **GREEN**. We have only included gels that do not contain glycerin, propylene glycol, or sorbitol. However, there are many gels on the market that contain a small percentage of these simple humectants, which may be fine and not frizz-causing. Those products can be found in our Ultimate Guide with over 100 gels.

Note

Many gels contain poly N-vinyl-2-pyrrolidone (PVP). PVP forms clear films over the hair, and is water soluble. However, similar to a simple humectant, in humid weather PVP can absorb water vapor from the air, making the hair sticky or tacky, and causing frizz. You may have to experiment with a few different gels to find what works best for you and your climate.
